CRITICALLY ENDANGERED

Illustration of a Saola standing on a green background.

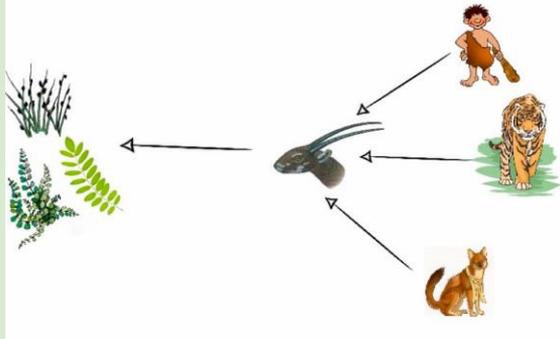

Diet

Saolas are herbivores. They eat fig leaves and other plants. They also eat seeds, fruit and berries.

Size

Saolas are about 35 inches and 4.9 feet long.

THE SAOLA'S FOOD CHAIN

Weight

Saolas weigh 176 to 220 pounds.

Why are they endangered?

Saolas are mostly hunted for their horns and are losing their habitat. The horns of these animals are really rare to find so people hunt them and sell them for expensive prices.

How can we save them from being endangered?

We can save them by stopping hunters hunting their horns. Teach people about the importance of saving animal species and biodiversity!
